

### Lab 6 Answers

1. Localization involves customizing internationalized software to suit a given language in a specific location.
2. Internationalization and Localization are important for software that is intended for use around the globe; it's even useful for software that is being developed in more than one country at a time. With an Internationalized product, any person competent in a language (or anybody with a language translator at hand) can easily make the product able to support any additional languages that they desire by localizing the product.

If a person in America wants to use a non-internationalized or non-localized product developed in Chinese, they would have to learn the language before being able to use the product.

However, if the product originally developed in Chinese has been internationalized and localized for American English, the user would have no problem using the product.
